Daily Business Report

Read the lead register, summarise the previous calendar day and send the result to Telegram. A repeatable snapshot of request volume, status and source.

The essentials, delivered where the team works.

A single message brings the previous day's request counts together. Managers can check activity without opening and filtering the register each morning.

Actual output from the lead register: 2 requests, both new, grouped under the form source.

See the flow of enquiries

Total requests, status breakdown and source breakdown make the day's activity quick to scan.

Keep the day boundary precise

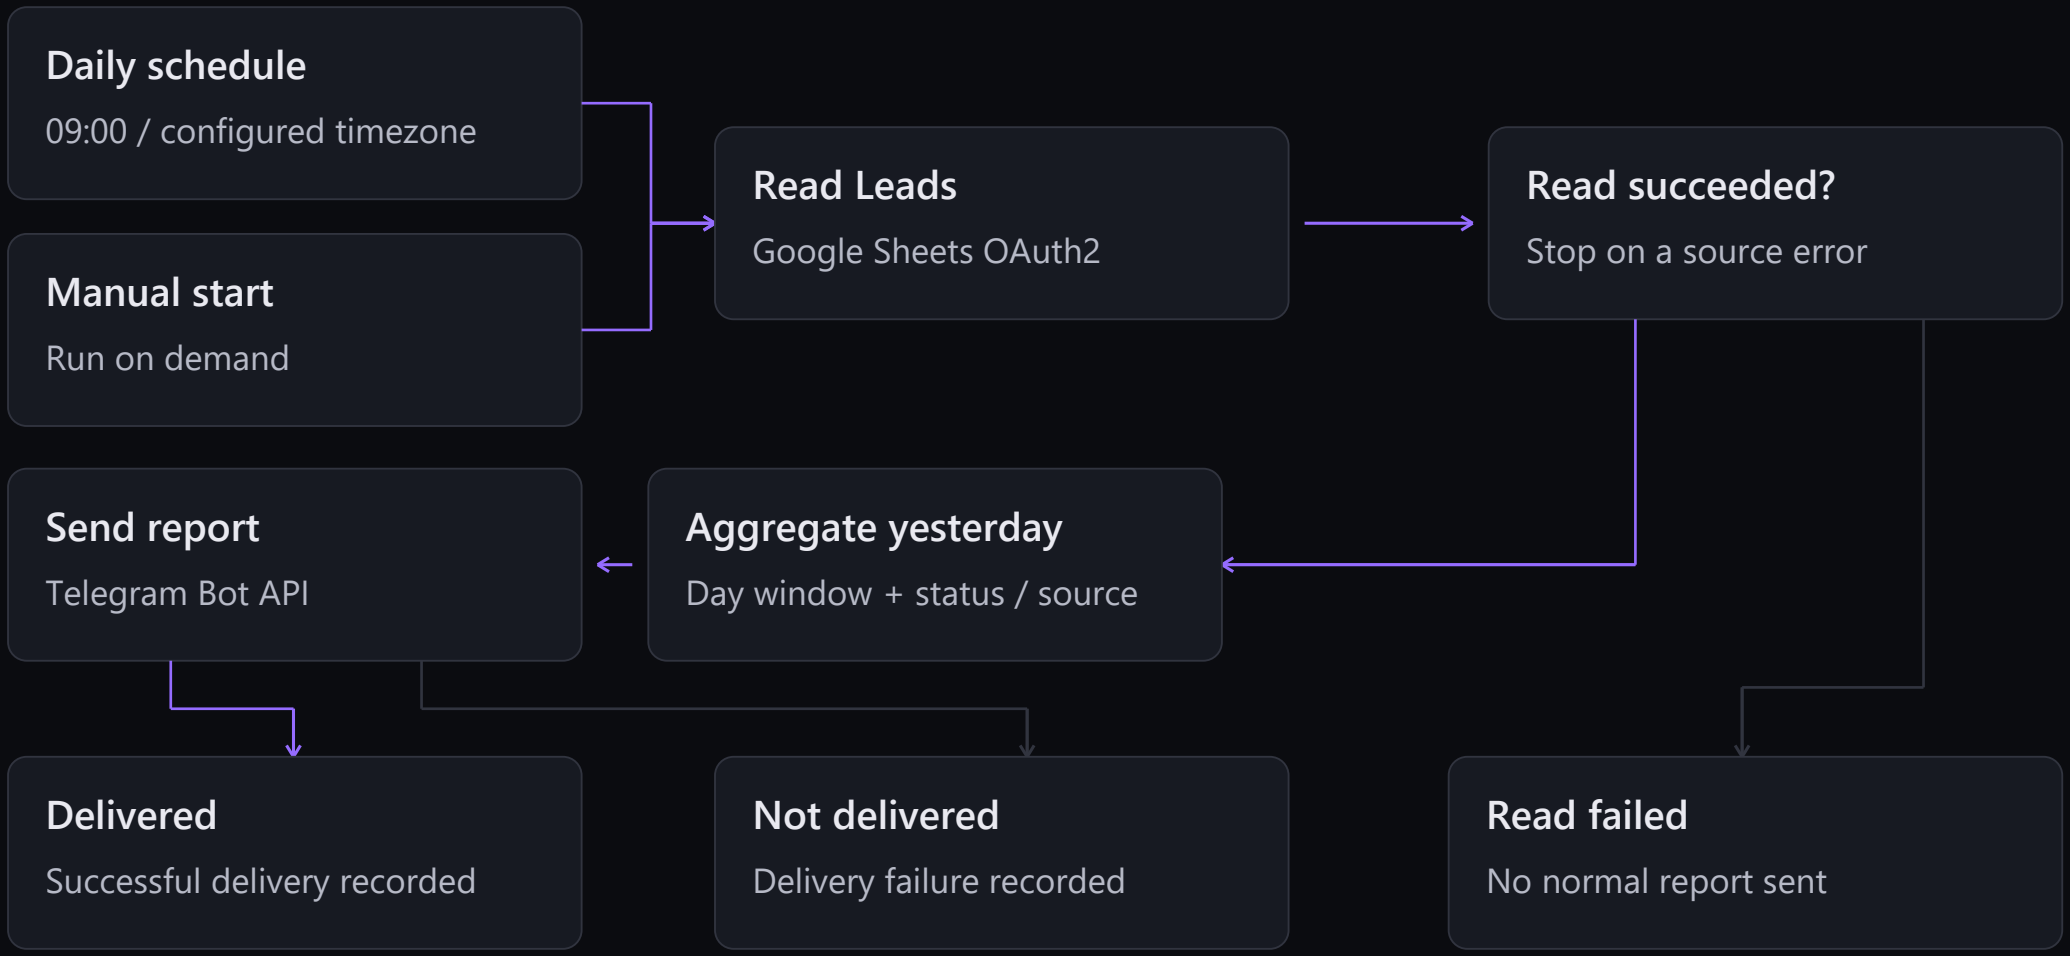

The report uses the previous calendar day in the configured timezone, including daylight-saving changes.

Know when data needs attention

The message includes data checks. Invalid rows are flagged so an incomplete total is easier to spot.

Read. Check. Aggregate. Deliver.

A scheduled or manual start reads Google Sheets. JavaScript applies the calendar-day window and groups valid lead rows before the Telegram Bot API sends the report.

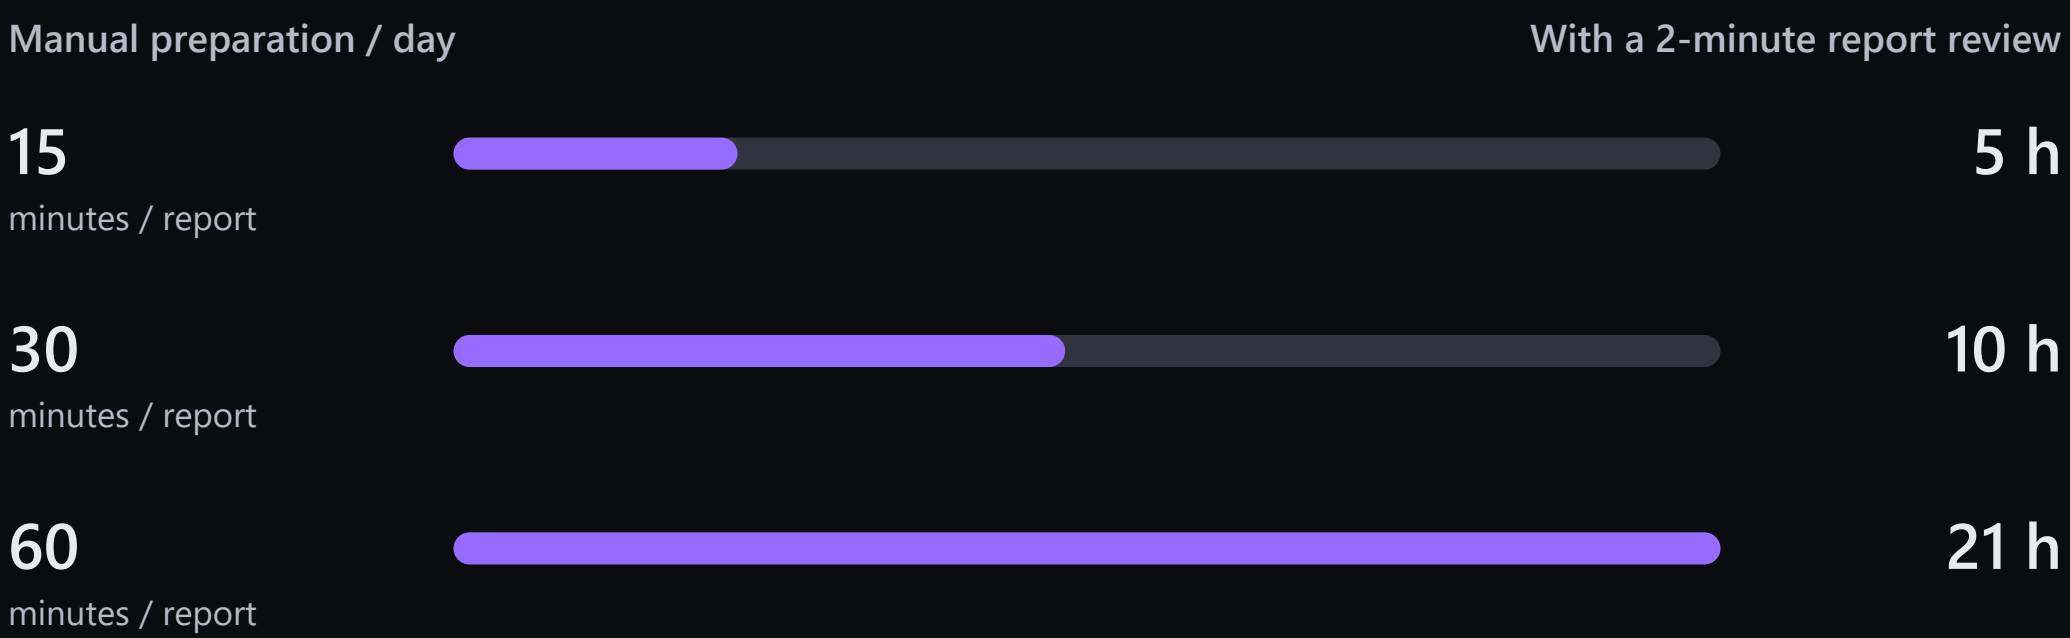

A failed read is different from a valid zero-request day. Source and delivery failures have separate outcomes.

Make reporting a habit, not a task.

A scheduled summary removes repeated filtering, counting and message preparation. The team reviews the result instead of rebuilding it.

Estimated time saved per month

Across 22 working days, the released time grows with the manual effort the report replaces. Counts stay tied to the same lead register.

The broader value is consistency: the same day window, the same breakdowns and an explicit signal when source data needs attention.
